

THE VISUAL CORTIX
IS VERY THIN—
JUST 0.08 IN (2 MM)

2 The visual cortex
Nerve signals progress through the various layers of the cortex, each adding more information to the image. It takes half a second for the image to be assessed and become a conscious perception.

AREAS OF THE VISUAL CORTIX

AREA	FUNCTION
V1	Responds to visual stimuli.
V2	Passes on information and responds to complex shapes.
V3A, V3D, VP	Registers angles and symmetry and combines motion and direction.
V4D, V4V	Responds to color, orientation, form, and movement.
V5	Responds to movement.
V6	Detects motion in periphery of visual field.
V7	Involved in perception of symmetry.
V8	Probably involved in processing of color.

VISUAL FIELD OF LEFT EYE

Image formed by brain after it combines images from left and right eyes' visual fields

BINOCULAR
VISUAL FIELD

VISUAL FIELD OF RIGHT EYE

FIELDS OF VISION

Animals such as primates have a large field of stereoscopic vision and can judge distances better than herbivores or most birds. However, they have a blind zone behind them that can be seen only by turning the head. Animals with eyes on the sides and top of the head have a wider field of 2-D vision and greater all-around awareness.
