

Earth's story

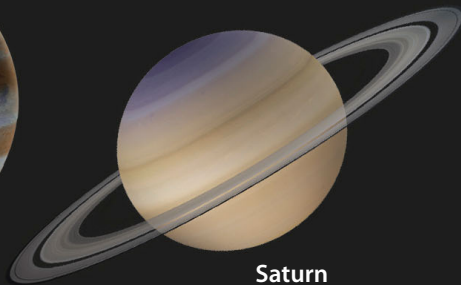

It is thought that Earth, and the other planets, formed as gravity forced material in clouds of gas and dust together, creating clumps of rock. These gradually grew bigger to form planets. Over time, the conditions on Earth evolved to support life.

Earth's orbit

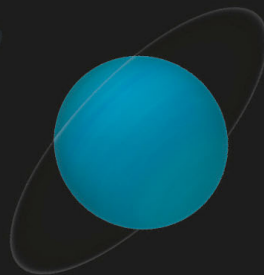

This is the path that the Earth takes as it travels around the Sun. Earth's orbit does not form a perfect circle. It is a slightly flattened circle, or oval. Earth takes 365 days, or a whole year, to make one complete journey around the Sun.

Jupiter

Saturn

Uranus

Neptune
